

KONIA SST - Screen Stretching Table

Konia SST is an electro-mechanical stretching apparatus with automatic stretching feature. It automatically stretches meshes in both warp and weft directions. Electric motors move stretching beams so that, firstly, electronic control of the same motors ensures extreme accuracy of the process, and secondly, within very short time, it is possible to adjust the table size to process different screens.

No mesh distortion is guaranteed cause stretching takes place in true alignment with the thread. There is no contact between frame and mesh during the process.

The apparatus is touch screen controlled and provided with a user friendly man/machine interface.

Control can be switched between Automatic and Manual.

Sizes with a tensioning area up to 4500 mm x 3500 mm are available.
